## Professional Summary

Software engineer focused on **mobile with Flutter** since 2020, with a full-stack background from healthcare and logistics software. I currently build healthcare apps at Pulsati for health plans, hospitals and dental clinics, including one with more than 100K downloads. I have been the sole mobile developer at a logistics operator, building a company-wide app from scratch, and I worked on the Tasy hospital management system at Philips, in the radiology and laboratory modules. I work with **BLoC and Clean Architecture**, automated testing, back-end integration (Java, REST, Supabase/PostgreSQL) and shipping to Google Play and the App Store. Advanced English (C1), used daily on projects for international clients.

## Selected Results

- Cut media upload and processing from **up to 5 minutes to 1 minute at most** in an inspection app handling 10–30+ photos and 1–5 minute videos (native Kotlin, Tecadi).
- Rebuilt the integration between the Tasy hospital system and a lab analyzer at one of Brazil's largest hospitals **within a 1-week deadline**, learning Delphi on the job (Philips).
- Refactored **around 20 crash-prone screens**, ending the weekly crash complaints and making those screens **10–20 seconds faster** (Philips).
- Redesigned and migrated to BLoC two healthcare apps in production, one with **100K+ downloads** and one with 10K+ (Pulsati).
- **Promoted from intern to junior developer in 12 months** and became the team's go-to person for refactoring legacy code (Philips).
- Shipped my own studio's platform (zirkon.com.br) to production with **557 Dart tests and 14 browser tests**, Lighthouse **100 for accessibility and 100 for SEO**, and deploys with no service-account keys.

## Professional Experience

**•Pulsati** *Mar 2025 – Present*

*Software Engineer / Mobile* Blumenau, Brazil — Remote

– Healthcare apps for health plans, hospitals and dental clinics — mobile (Flutter), web (React) and back end (Java).
– Contract renewed after the first six months, with a wider remit on the mobile team.
– Redesigned around 20 screens across UsiSaúde (100K+ downloads) and HMC – Hospital Márcio Cunha (10K+), both on Google Play and the App Store, and shipped every HMC relaunch after its first release.
– Built a shared component library for both apps, migrated state management to BLoC and kept them store-compliant with Flutter and SDK upgrades.
– Delivered biometric login, push reminders, online scheduling and check-in, virtual membership card, exam results, prescriptions, authorization tracking and provider search.
– Made the apps faster and smoother: pagination and lazy loading on long lists, a local cache layer, a request queue for bulk actions on exam lists, and new animations; adaptive layouts for small phones, tablets and large accessibility fonts.
– Protected patient data under Brazil's LGPD, with secure storage and session-token handling.
– Added unit, widget and API service tests, plus crash handling, error logging and clear user-facing error messages.
– Rebuilding iConsulta, Dentalis's appointment-booking app for dental clinics, as a full migration to Flutter.
– Learned React on the job to ship report generation in Maida's beneficiary portal, plus the Java endpoints behind it.
– **Tech:** Flutter, Dart, BLoC, React, Java, REST APIs, unit and widget testing, local caching, secure storage, LGPD, Android and iOS.

**•TECADI Logistics Operator** *Nov 2024 – Mar 2025*

*Software Engineer / Mobile* Timbó, Brazil — On-site

– Logistics operator. Sole mobile developer, with a tech lead reviewing, on the company's employee and operations apps.
– Built Meu Tecadi, the company app for all employees, from scratch in Flutter: chose the architecture (BLoC + Clean Architecture) and shipped corporate login, an announcements feed, push notifications and offline storage with SQLite. Launched on Google Play and the App Store in January 2025.
– Implemented the ERP communication service, laying the groundwork for running ERP processes inside the app.
– Cut media upload and processing wait in the Logi360 Checklist app from up to 5 minutes to 1 minute at most, for inspections with 10–30+ photos and 1–5 minute videos. Built in native Kotlin: on-device compression and chunked uploads over streams in a background service, with retry on connection loss and a notification when done.

– Handled large API responses with pagination, streaming and local caching.
– Maintained and extended the shared internal plugin used by all Tecadi apps: theme (fonts, colours), HTTP client with auth tokens, interceptors and error handling, and reusable widgets.
– **Tech:** Flutter, Dart, BLoC, Clean Architecture, SQLite, Firebase, Kotlin, modular architecture, REST APIs, Android and iOS.

**•Zirkon Labs** *Jul 2023 – Nov 2024*

*Software Engineer | Mobile* Self-employed — Remote

– My own software studio: end-to-end mobile app development, from client discovery through to delivery.
– Built the Flutter app for a spaced-repetition English learning platform over 8 months, working with a Python back-end developer. The app runs on Android and iOS and is used privately by around 100 students of the teacher who commissioned it.
– Delivered Anki-style review scheduling, teacher and student accounts, progress charts for the teacher, audio for pronunciation and offline study with a local database, plus Anki deck import through the back-end API.
– Owned every architecture, state-management and testing decision alone, with no more experienced team to fall back on.
– **Tech:** Flutter, Dart, BLoC/Cubit, Clean Architecture, local database, REST APIs, Android and iOS.

**•Philips** *Dec 2021 – Apr 2023*

*Software Engineer* Blumenau, Brazil — Hybrid

– Tasy hospital management system at Philips Blumenau R&D, on the roughly 20-person radiology and laboratory team. Covers my intern and junior periods.
– Rebuilt the connection between Tasy and a lab analyzer at one of Brazil's largest hospitals after Microsoft discontinued a DLL the integration depended on, leaving the analyzer unable to talk to the system. Delivered within a 1-week deadline, learning Delphi on the job and working directly with the hospital's DBA.
– Refactored around 20 crash-prone screens and modules — removing unnecessary validations, fixing error and null handling and rewriting SQL/PL-SQL queries — ending the weekly crash complaints and making those screens 10–20 seconds faster.
– Became the team's go-to person for refactoring legacy code: reviewed teammates' code, helped them with their tasks and wrote a clean code guide for the team.
– Promoted from intern to junior developer after 12 months.
– **Tech:** Java, JavaScript, Delphi, Oracle Database, PL/SQL, React.

## Technical Skills

**Core (daily use, can defend in an interview)**: Flutter, Dart, BLoC, Clean Architecture, Kotlin (native Android), Firebase, Supabase, PostgreSQL, SQLite, REST APIs, Git/GitHub, shipping to Google Play and the App Store
**Working knowledge**: React, Java, JavaScript, C#/.NET, Oracle Database, PL/SQL, Delphi, Riverpod, Provider, unit and widget testing, Material Design 3, accessibility, i18n
**Exposure**: Flutter Web (WebAssembly), GitHub Actions, Firebase Hosting, Google Cloud, Playwright, golden tests, Node.js, SQL Server, MySQL, SonarQube, SVN
**Applied AI**: Gemini API in production (reading and structuring receipts), prompt engineering for data extraction, LLM integration inside a Flutter app
**Architecture and practices**: Clean Architecture, BLoC/Cubit, modular architecture, MVVM, testable code, code review, Conventional Commits, CI/CD, build-once-promote, data protection and secure storage, mobile performance and profiling
**Areas of interest**: mobile development with Flutter, software architecture, applied AI in products, systems integration, automated testing, DevOps
**Soft skills**: clear communication with business teams, mentoring and code review, autonomy in a remote team, translating requirements into technical solutions, analytical thinking

## Published Apps

- **UsiSaúde** — 100K+ downloads on Google Play — interface redesign, BLoC migration, biometric login, scheduling and exam results *(Pulsati)*.
- **HMC – Hospital Márcio Cunha** — 10K+ downloads — redesign and every relaunch after the first release *(Pulsati)*.
- **iConsulta (Dentalis)** — 1K+ downloads — full migration to Flutter, in progress *(Pulsati)*.
- **Meu TECADI** — launched Jan 2025 — company app built from scratch, Google Play and the App Store *(Tecadi)*.
- **Logi360 Checklist** — field inspection app — native Kotlin media upload optimisation *(Tecadi)*.
- **Zsplit** — my own product, launching October 2026 *(personal)*.

## Projects

**•Zsplit — group expense splitting with AI receipt scanning** *2025 – Present*

*My own product. Flutter app that splits expenses for group events and gatherings.*

- Receipt scanning with the Gemini API: the app sends a photo, the model reads every line with its quantity and price, validates what is actually a purchased item and returns the list ready to assign to people.
- Relational modelling on Supabase (PostgreSQL) with row-level security, balances calculated in SQL and the event lifecycle automated in the database.
- Full authentication with persistent session, password recovery and secure credential storage via Keychain/Keystore.
- **Tech:** Flutter, Dart, BLoC, Clean Architecture, Supabase, PostgreSQL, Gemini API, Android and iOS.

**•Zirkon Labs — platform and website (zirkon.com.br)** *2026*

*The website and platform of my own software studio, in production since October 2026.*

- Shipped zirkon.com.br to production (v1.0.0, Oct 2026): a bilingual single-page site in Flutter Web compiled to WebAssembly, with an 11-component design system, state in Cubits and PT/EN routes.
- Built the GitHub Actions pipeline on a build-once-promote model — the same tested artifact reaches preview, staging and production — with release-please gating production, mandatory human approval and signed build provenance verified before any rollback.
- Infrastructure on Firebase Hosting across three environments, deploys with no service-account keys via Workload Identity Federation, least-privilege roles, Google Cloud organisation policies blocking key creation, and Content Security Policy enforced in production.
- 557 Dart tests (unit, widget, golden with alchemist and page tests) and 14 Playwright browser tests running against the real build served by the Firebase Hosting emulator, before the artifact is published.
- Measured outcomes: Lighthouse 100 for accessibility and 100 for SEO, 0.96 s LCP and a 2.19 MB first load — a 36.6% reduction after replacing the icon library with a custom font carrying only the glyphs in use.
- **Tech:** Flutter, Dart, Flutter Web (WebAssembly), BLoC/Cubit, GitHub Actions, Firebase Hosting, Google Cloud, Workload Identity Federation, Playwright, Cloudflare DNS.

**•A Couple Tasks** *2024*

*Prototype productivity and household organisation app for couples and friends. On hold.*

- Shared goal setting and gamified achievements, with an interface based on Material Design 3.
- **Tech:** Flutter, Firebase, SQLite, Clean Architecture.

## Education

**•Bachelor's Degree in Software Engineering** *In progress*

*Ampli* Feb 2022 – Dec 2027 (expected)

**•Technical Degree in Information Technology (integrated with high school)** *Completed*

*Federal Institute of Santa Catarina (IFSC)* Jan 2015 – Dec 2017

## Languages

**Portuguese**: native

**English**: advanced (C1) — daily professional use in technical documentation and written communication
